Information plays a central role in society today, and it is becoming more and more common for that information to be offered in digital form alone. The reliable, user-friendly Portable Document Format (PDF) has become the world's file type of choice for providing information as a digital document.

Tags can be added to a PDF in order to structure the content of a document. These tags are a critical requirement if any form of assistive technology (such as screen readers, specialist mice, and speech recognition and text-to-speech software) is to gain access to this content. To date, PDF documents have rarely been tagged, and not all software can make use of PDF tags. In practical terms, this particularly reduces information's accessibility for people with disabilities who rely on assistive technology.
